

## Aflevering\_2

### **Reason for ER diagram changes:**

The diagram can be seen on the next page (Figure 1).

#### **- removed:**

we removed an attribute called "GuestIdentifier" that was connected to the "guest" entity.

Its purpose was to provide a failsafe to when the guest wasn't able to be contacted through the phone number.

It focuses more on the business side of the perspective which we decided to cut away.

and Nicolajs ER-diagram

#### **- added:**

"providerId" for the "Provider" entity was added due to having something other than CVR as primary key.

A group member mentioned that a business CVR can be changed from a company. and its an outside sort of ID.

The ID added is a version that is local for the app and is individual.

"ExperienceId" at the "discount" entity.

This was added since discount didn't have a way to link
